

PROCESS INTEGRATION

YOUR GREEN WAY TO SHIP

Touchpoint API

Follow your container at all times with BCTN's end-to-end container visibility solution. Receive process touchpoints directly in your system via our API.

Why the BCTN Touchpoint API?

The world of intermodal freight transport often involves a complex transportation chain with many different stakeholders. The inability to follow your container can cause a lot of problems to your daily operation but also to your strategic position.

BCTN anticipated these problems by developing IT products that create value in your container tracking and automation to reach a sustainable, scalable and streamlined operation.

Does your organization face one of the following problems?

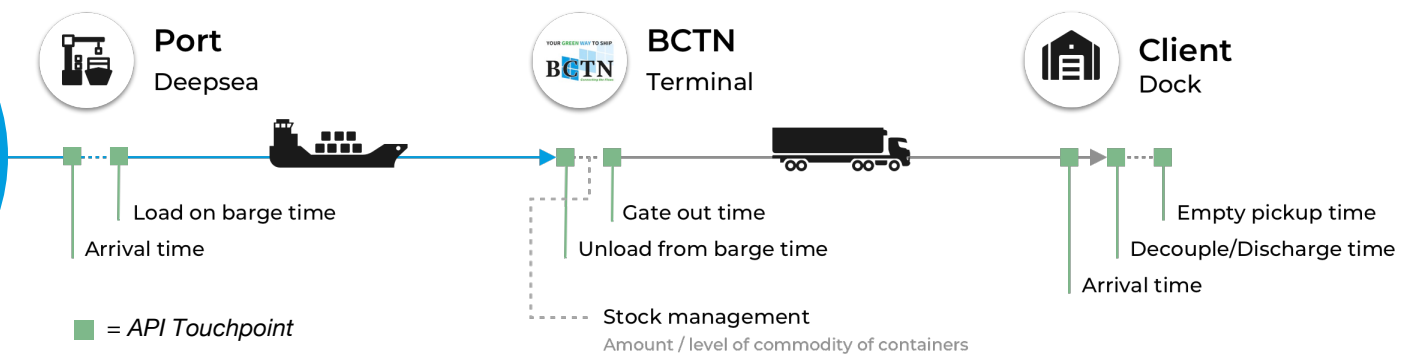

- You have difficulty following the status of your containers
- You do not (always) know where your container is
- You do not want to continuously check your partners' portals / websites for status updates

How does the BCTN Touchpoint API work?

The BCTN Touchpoint API has been developed to seamlessly increase connectivity with your operational systems. So what is the Touchpoint API and how does it work?

In fact, the BCTN Touchpoint API is a shared collection of “touch” points from the logistical process of transporting your container. Via our API, you can “get” timestamps such as [the estimated arrival time at the deepsea terminal](#), [estimated arrival time at the loading/discharge dock](#) and [redelivery date](#).

Developed in a JSON format, our Endpoint API enables you to request and “pull” container information to your operational systems at any given time.

Benefits of the BCTN Endpoint API

- ✓ Automatically pull container status updates to your operational systems without visiting a website or portal
- ✓ Full transparency over 7 process touchpoints
- ✓ Extensive (online) documentation for IT / developers
- ✓ Full flexibility in container data usage / visualization in your own systems

Process Integration INTEGRATED SOLUTION

BCTN Endpoint API

API interface to retrieve 7 BCTN process touchpoints

Extensive documentation for your system developers / IT
